

Basic tutorial for navigating terminal.

How to see what's in a folder

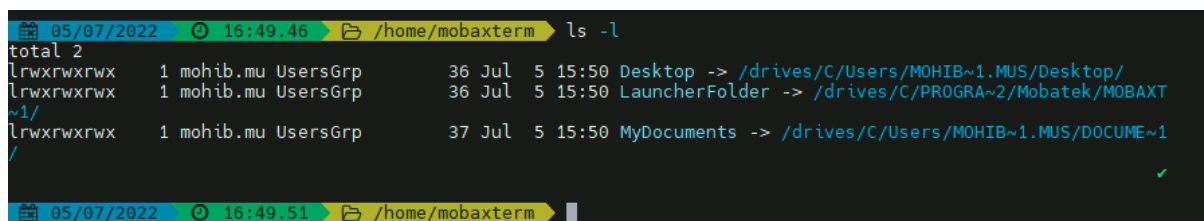

When you first get to the command line, you're in your home folder. While you're there—or when you're in any folder (*directory* in Unix-speak)—you might want to know what's in it. To do that you use the `ls` (or *list*) command. Type `ls` and press the Return key, and you'll see the folders (and/or files) in the current directory.

```
05/07/2022 16:24.50 /home/mobaxterm ls
Desktop LauncherFolder MyDocuments

05/07/2022 16:25.04 /home/mobaxterm
```

The output of the plain `ls` command is pretty sparse; it shows you the names of files and folders contained in the current directory (including some familiar ones such as Desktop, MyDocuments and so on). Fortunately, you can add a number of optional *switches* to the `ls` command that allow you to see more information. For example, type `ls -l` (that's a lower-case L), then press Return. You'll see something like this:

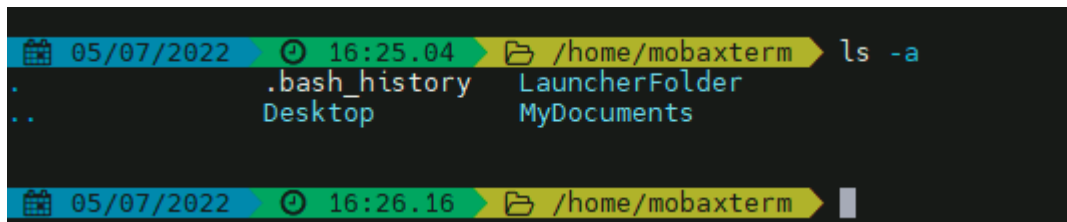

```
05/07/2022 16:49.46 /home/mobaxterm ls -l
total 2
lrwxrwxrwx 1 mohib.mu UsersGrp 36 Jul 5 15:50 Desktop -> /drives/C/Users/MOHIB~1.MUS/Desktop/
lrwxrwxrwx 1 mohib.mu UsersGrp 36 Jul 5 15:50 LauncherFolder -> /drives/C/PROGRA~2/Mobatek/MOBAXT
~1/
lrwxrwxrwx 1 mohib.mu UsersGrp 37 Jul 5 15:50 MyDocuments -> /drives/C/Users/MOHIB~1.MUS/DOCUME~1
/

05/07/2022 16:49.51 /home/mobaxterm
```

Don't worry too much about what all that means right now—we're just getting our feet wet. The point is that `ls` can provide additional information about files and

folders, depending on the options you specify.

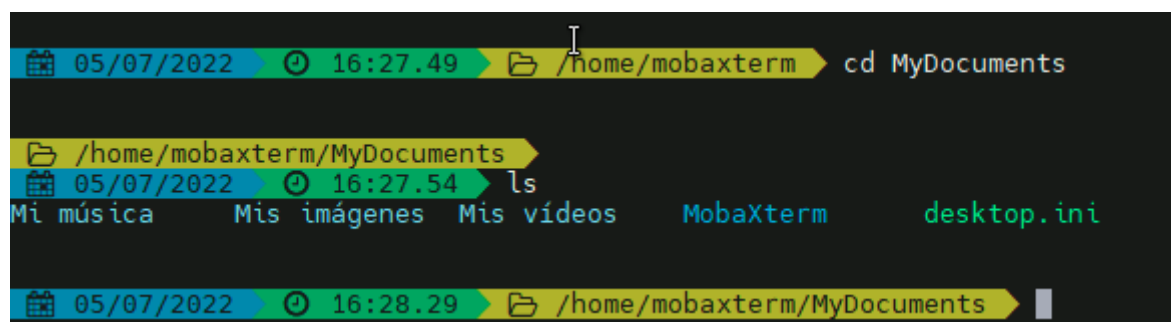

One other handy option: You can view *invisible* files—ones that the Explorer doesn't normally show you—by typing `ls -a`. (These hidden files all have dots (.) in front of their names.)

```
05/07/2022 16:25.04 /home/mobaxterm ls -a
.bash_history  LauncherFolder
..            Desktop      MyDocuments
```

How to access other folders/directories

When you're in the explorer and you want to move to another folder, you find that folder and double-click it. From the command line, you use the `cd` (or *change directory*) command instead. So let's say you're in your Home folder and want to peek inside the MyDocuments folder. To do that, you'd type `cd MyDocuments`. (Remember to always type a space after any command that has an additional argument, such as the name of a directory in the previous example.) Once you've done that, `ls` will show you the contents of your MyDocuments folder.

```
05/07/2022 16:27.49 /home/mobaxterm cd MyDocuments
/home/mobaxterm/MyDocuments
05/07/2022 16:27.54 ls
Mi música  Mis imágenes  Mis vídeos  MobaXterm  desktop.ini
```

- If you type `cd` and press the Return key—with no directory specified—you'll go back to your Home folder. (You can also type `cd ~` to go there.)
- If you type `cd /`, you'll go to the root level of your startup disk.
- If you type `cd ..` (that's two periods), you'll go to the directory above the one you're currently in. So if you're in your home folder type `cd ~`, and type `cd ..`,

you'll go one folder up.

- And if you type `cd -` (hyphen) you'll go back to the directory you were in before the last time you issued the `cd` command.

Creating a new Folder/directory

lets say we are in our home folder type `cd ~` and we want to create a new folder/directory called folder1 we type `mkdir folder1` this creates a new folder/directory in the home directory called folder1

if we type `ls` we see that indeed there a new directory called folder1

```
05/07/2022 16:41.11 /home/mobaxterm > mkdir folder1

05/07/2022 16:41.24 /home/mobaxterm > ls
Desktop      LauncherFolder  MyDocuments  folder1

05/07/2022 16:41.26 /home/mobaxterm > 
```

Creating an empty file

Let's go inside the folder we just created by typing `cd folder1` and create an empty text file called my_file.txt. For this we type `touch my_file.txt` This creates a new file called my_file.txt in the folder named folder1 and by typing `ls` we can confirm that the file exists

```
05/07/2022 16:47.05 /home/mobaxterm > cd folder1

05/07/2022 16:47.09 /home/mobaxterm/folder1 > touch my_file.txt

05/07/2022 16:47.27 /home/mobaxterm/folder1 > ls
my_file.txt

05/07/2022 16:47.29 /home/mobaxterm/folder1 > 
```
